Lecture 4 - The Finite Volume Method in 1D

Sections 4.3, 8.2-8.4 (Versteeg)

ME $2256/\text{MEMS}\ 1256$ - Applications of Computational Heat and Mass Transfer

 $\label{eq:mechanical engineering and Materials Science Department} \\ \text{University of Pittsburgh}$

Lecture 4 - The Finite Volume Method in 1D

ME 2256/MEMS 1256

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

> 2.1 Explicit heme

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit

Student Learning Objectives

At the end of the lecture, students should be able to:

- ► Construct the 1D FVM for transient behavior of the diffusion equation.
- Construct the 1D diffusion equation with source terms.
- ► Formulate convective heat transfer boundary conditions for the 1D diffusion.

Lecture 4 - The Finite Volume Method in 1D

 ${\rm ME~2256/MEMS}\atop 1256}$

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

> 2.1 Explicit theme

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Generalized Transport Equation

▶ Recall the transport equation in vector form:

$$\underbrace{\frac{\partial}{\partial t}(\rho\phi)}_{\text{Accumulation}} + \underbrace{\nabla \cdot (\rho \vec{V}\phi)}_{\text{Advection}} = \underbrace{\nabla \cdot (\Gamma \nabla \phi)}_{\text{Diffusion}} + \underbrace{S}_{\text{Generation}}$$

- $ightharpoonup \phi o conserved quantity$
- $ightharpoonup \Gamma o diffusion coefficient$
- $\rho \to \text{density}$
- Now, considering the accumulation and diffusion terms, we are left with:

$$\frac{\partial}{\partial t}(\rho\phi) = \nabla \cdot (\Gamma \nabla \phi)$$

Lecture 4 - The Finite Volume Method in 1D

 $\begin{array}{c} \mathrm{ME}\ 2256/\mathrm{MEMS} \\ 1256 \end{array}$

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

> 2.1 Explicit cheme

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

The Four Rules of FVM

- ► For the finite volume method to be implemented properly, we must obey the four following rules:
 - 1. The flux across an interface between two adjacent control volumes must be represented by the same expression, and must be conserved, unless dictated by some other conservation equation.
 - 2. The coefficients for a_P and a_{nb} must be the same sign, such that an increase of the neighboring values leads to an increases in the value at P, or a decrease of the neighboring values leads to a decrease in the value at P.

Lecture 4 - The Finite Volume Method in 1D

ME 2256/MEMS 1256

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

.2.1 Explicit cheme

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

The Four Rules of FVM

- 3. When linearizing a source term (to be discussed later), the slope must be negative or zero, such that the non-linear term has a zero or negative value, such that Rule 2 is obeyed.
- 4. We have already stated that $a_P = \sum a_{nb}$, and this must hold true if the dependent variable at P and nb are increased by some constant.

Lecture 4 - The Finite Volume Method in 1D

ME 2256/MEMS 1256

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

2.1 Explicit cheme

8.2.2

Scheme

8.2.3 Fully Implicit Scheme

1D Transient Transport Equation

Calling the diffusion coefficient κ and the conserved quantity T, and considering a system of constant density and specific heat, in one-dimension we can expression the transport equation as:

$$\rho C \frac{\partial T}{\partial t} = \frac{\partial}{\partial x} \left(\kappa \frac{\partial T}{\partial x} \right)$$

▶ Why is specific heat now added to the system of equations?

Lecture 4 - The Finite Volume Method in 1D

ME 2256/MEMS 1256

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

2.1 Explicit cheme

8.2.2

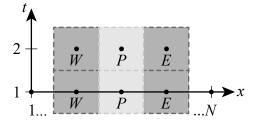

Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Temporal and Spatial Marching

- ▶ We have to march forward in time to resolve the change of temperature.
- ▶ We have to spatially resolve our temperature, based upon the east and west neighbors:

▶ Thus, we have to integrate over the time control volume and time interval.

Lecture 4 - The Finite Volume Method in 1D

 $\begin{array}{c} \mathrm{ME}\ 2256/\mathrm{MEMS} \\ 1256 \end{array}$

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

Scheme

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Temporal Term

Recalling Δx is the cell size and δx is the distance between cell centers

$$\rho C \int_{w}^{e} \int_{t}^{t+\Delta t} \frac{\partial T}{\partial t} dt dx = \int_{t}^{t+\Delta t} \int_{w}^{e} \frac{\partial}{\partial x} \left(\kappa \frac{\partial T}{\partial x} \right) dx dt$$

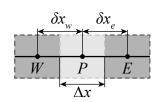

► The LHS can be solved as:

$$\rho C \int_{w}^{e} \int_{t}^{t+\Delta t} \frac{\partial T}{\partial t} dt dx$$

$$= \rho C x \Big|_{w}^{e} \Delta T \Big|_{t}^{t+\Delta t}$$

$$= \rho C (x_{e} - x_{w}) (T_{P}^{t+\Delta t} - T_{P}^{t})$$

$$= \rho C \Delta x (T_{P}^{2} - T_{P}^{1})$$

Lecture 4 - The Finite Volume Method in 1D

 ${\rm ME~2256/MEMS}\atop 1256$

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

2.1 Explicit cheme

8.2.2

Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Spatial Marching

▶ We have already constructed a method to solving the spatial integral of the diffusion term such that the RHS becomes:

$$\int_{t}^{t+\Delta t} \int_{w}^{e} \frac{\partial}{\partial x} \left(\kappa \frac{\partial T}{\partial x} \right) dx dt$$

$$= \int_{t}^{t+\Delta t} \left(\frac{\kappa_{e} (T_{E} - T_{P})}{\delta x_{e}} - \frac{\kappa_{w} (T_{P} - T_{W})}{\delta x_{w}} \right) dt$$

We must assume how T_P , T_E and T_W vary between t and $t + \Delta t$:

$$\int_{t}^{t+\Delta t} T_{P} dt = (fT_{P}^{2} + (1-f)T_{P}^{1}) \, \Delta t$$

▶ The weight factor is bounded such that $0 \le f \le 1$.

Lecture 4 - The Finite Volume Method in 1D

 $\begin{array}{c} \mathrm{ME}\ 2256/\mathrm{MEMS} \\ 1256 \end{array}$

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

Scheme

8.2.2 Crank-Nicolso Scheme

8.2.3 Fully Implicit Scheme

Worked Example:

Assuming a weighting factor, we can express the RHS as:

$$\int_{t}^{t+\Delta t} \left(\frac{\kappa_{e}(T_{E} - T_{P})}{\delta x_{e}} - \frac{\kappa_{w}(T_{P} - T_{W})}{\delta x_{w}} \right) dt$$

$$= f \left(\frac{\kappa_{e}(T_{E}^{2} - T_{P}^{2})}{\delta x_{e}} - \frac{\kappa_{w}(T_{P}^{2} - T_{W}^{2})}{\delta x_{w}} \right) \Delta t$$

$$+ (1 - f) \left(\frac{\kappa_{e}(T_{E}^{1} - T_{P}^{1})}{\delta x_{e}} - \frac{\kappa_{w}(T_{P}^{1} - T_{W}^{1})}{\delta x_{w}} \right) \Delta t$$

Lecture 4 - The Finite Volume Method in 1D

ME 2256/MEMS 1256

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

.2.1 Explicit

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Therefore, if we divide out Δt , our transient, 1D diffusion equation becomes:

$$\rho C \frac{\Delta x}{\Delta t} (T_P^2 - T_P^1) = f \left(\frac{\kappa_e (T_E^2 - T_P^2)}{\delta x_e} - \frac{\kappa_w (T_P^2 - T_W^2)}{\delta x_w} \right) + (1 - f) \left(\frac{\kappa_e (T_E^1 - T_P^1)}{\delta x_e} - \frac{\kappa_w (T_P^1 - T_W^1)}{\delta x_w} \right)$$

Now we have to re-arrange for T_P^2 .

Lecture 4 - The Finite Volume Method in 1D

ME 2256/MEMS 1256

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

.2.1 Explicit cheme

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

▶ Call T_P^2 just T_P , and T_P^1 our initial time T_P^0 , which is valid for both T_W and T_E , we have:

$$\rho C \frac{\Delta x}{\Delta t} (\mathcal{T}_{P}^{2}) = f \left(\frac{\kappa_{e} (\mathcal{T}_{E}^{2} - \mathcal{T}_{P}^{2})}{\delta x_{e}} - \frac{\kappa_{w} (\mathcal{T}_{P}^{2} - \mathcal{T}_{W}^{2})}{\delta x_{w}} \right)^{T_{W}}$$

$$+ (1 - f) \left(\frac{\kappa_{e} (\mathcal{T}_{E}^{2} - \mathcal{T}_{P}^{2})}{\delta x_{e}} - \frac{\kappa_{w} (\mathcal{T}_{P}^{2} - \mathcal{T}_{W}^{2})}{\delta x_{w}} \right)^{T_{W}^{0}}$$

$$+ \rho C \frac{\Delta x}{\Delta t} (\mathcal{T}_{P}^{2})$$

Lecture 4 - The Finite Volume Method in 1D

ME 2256/MEMS 1256

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

.2.1 Explicit cheme

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

▶ We will also define the following coefficients:

$$a_E = \frac{\kappa_e}{\delta x_e}; \qquad a_W = \frac{\kappa_w}{\delta x_w}$$

$$a_P^0 = \frac{\rho C \Delta x}{\Delta t}; \qquad a_P = f a_E + f a_W + a_P^0$$

$$\rho C \frac{\Delta x}{\Delta t}(T_P) = f\left(\frac{\kappa_{ef}}{\delta x_e}(T_E - T_P) - \frac{\kappa_{w}}{\delta x_w}(T_P - T_W)\right)
+ (1 - f)\left(\frac{\kappa_{ef}}{\delta x_e}(T_E^0 - T_P^0) - \frac{\kappa_{w}}{\delta x_w}(T_P^0 - T_W^0)\right)
+ \rho C \frac{\Delta x}{\Delta t}(T_P^0)$$

Lecture 4 - The Finite Volume Method in 1D

ME 2256/MEMS 1256

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

.2.1 Explicit

8.2.2

Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

FV Formulation

▶ Consolidating, we arrive at our final expression:

$$a_P T_P = a_E (f T_E + (1 - f) T_E^0) + a_W (f T_W + (1 - f) T_W^0)$$
$$+ (a_P^0 - (1 - f) a_E - (1 - f) a_W) T_P^0$$

- ightharpoonup The importance of f is seen in how we calculate the solution:
 - 1. If f=0, we are taking all T values from previous time-step (explicit method).
 - 2. If f=1, we are taking all T values at the current time-step (implicit method).
 - 3. If f=0.5, we have a blend of previous and current values (Crank-Nicolson).

Lecture 4 - The Finite Volume Method in 1D

 $\begin{array}{c} \mathrm{ME}\ 2256/\mathrm{MEMS} \\ 1256 \end{array}$

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

2.1 Explicit

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Explicit Scheme

▶ If we set f=0:

$$a_{P}T_{P} = a_{E}(fT_{E}^{0} + (1-f)T_{E}^{0}) + a_{W}(fT_{W}^{0} + (1-f)T_{W}^{0}) + (a_{P}^{0} - (1-f)a_{E} - (1-f)a_{W})T_{P}^{0}$$

▶ We are left with:

$$a_P T_P = a_E T_E^0 + a_W T_W^0 + (a_P^0 - a_E - a_W) T_P^0$$

▶ Our temperature at the current time-step is completely, and only, dependent on the temperatures at the previous time-step.

Lecture 4 - The Finite Volume Method in 1D

ME 2256/MEMS 1256

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

8.2.1 Explicit Scheme

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Explicit Scheme - Limitations

- ► For this scheme to be of use, we have to introduce the rule of positive coefficients:
- ▶ All coefficients (a_P and the neighbors a_{nb}) must always be positive.
- ► That is, the increase in value of one grid point should lead to an *increase* in value of neighboring grid points.

$$a_P T_P = a_E T_E^0 + a_W T_W^0 + (a_P^0 - a_E - a_W) T_P^0$$

• What condition can result in T_P^0 becoming negative?

Lecture 4 - The Finite Volume Method in 1D

ME 2256/MEMS 1256

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

8.2.1 Explicit Scheme

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Explicit Stability Condition

► Recalling our coefficients:

$$a_P^0 = \frac{\rho C \Delta x}{\Delta t}; \quad a_E = \frac{\kappa_e}{\delta x_e}; \quad a_W = \frac{\kappa_w}{\delta x_w}$$

Determining a condition where $a_P^0 > a_E + a_W$, assuming uniform conductivity and $\Delta x = \delta x_e = \delta x_w$

$$\frac{\rho C \Delta x}{\Delta t} > \frac{2\kappa}{\Delta x} \implies \Delta t < \frac{\rho C \Delta x^2}{2\kappa}$$

Lecture 4 - The Finite Volume Method in 1D

ME 2256/MEMS 1256

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

8.2.1 Explicit Scheme

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Crank-Nicolson

- ▶ When f=0.5, the scheme is referred to as unconditionally stable.
- ▶ That does not mean the result will be physically realistic, rather, a mathematical solution can be obtained.
- ▶ Looking at the coefficient of T_P^0 when f=0.5:

$$a_P^0 - \frac{a_E + a_W}{2}$$

▶ For a_P^0 to be less than the average of a_E and a_W :

$$\frac{\rho C \Delta x}{\Delta t} > \frac{\kappa}{\Delta x} \implies \Delta t < \frac{\rho C \Delta x^2}{\kappa}$$

Lecture 4 - The Finite Volume Method in 1D

ME 2256/MEMS 1256

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

2.1 Explicit cheme

8.2.2

Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Implicit Scheme

▶ If we set f=1:

$$a_{P}T_{P} = a_{E}(fT_{E} + (1 - f)T_{E}^{0}) + a_{W}(fT_{W} + (1 - f)T_{W}^{0})^{0} + (a_{P}^{0} - (1 - f)a_{E}^{0} - (1 - f)a_{W})T_{P}^{0}$$

▶ We are left with:

$$a_P T_P = a_E T_E + a_W T_W + a_P^0 T_P^0$$

- \blacktriangleright As it stands, a_P^0 is always positive.
- Now, this may seem like the best scheme, but for small time-steps, the Crank-Nicolson scheme is more accurate.

Lecture 4 - The Finite Volume Method in 1D

Learning Objectives

8.2 One-dimensional Unsteady Heat Conduction

2.1 Explicit cheme

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Full 1D Implicit Diffusion Equation

▶ We have arrived at the complete, 1D, implicit, transient diffusion equation with source terms:

$$a_P T_P = a_E T_E + a_W T_W + b$$

▶ With the following coefficients:

$$a_E = \frac{\kappa_e}{\delta x_e}; \quad a_W = \frac{\kappa_w}{\delta x_w}; \quad a_P^0 = \frac{\rho C \Delta x}{\Delta t}$$
$$b = S_C \Delta x + a_P^0 T_P^0$$
$$a_P = a_E + a_W + a_P^0 - S_P \Delta x$$

We will introduce the components of our source terms, S_C and S_P

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Volumetric Sources

- \blacktriangleright If we have a volumetric source, S:
 - $\phi \to \text{energy}, S \to q^{\text{""}}, \text{volumetric heat}$ generation rate
 - $ightharpoonup \phi o concentration, S o R$, volumetric reaction rate
 - $ightharpoonup \phi o ext{turbulence energy, } S o$ production/dissipation of turbulence
- ▶ In one-dimension:

$$\frac{\partial}{\partial x} \left(\Gamma A \frac{\partial \phi}{\partial x} \right) + S \cdot \left(\underbrace{A}_{\Delta y \, \Delta z} \right) = 0$$

► Integrating in the x-direction:

Integrating in the x-direction:
$$\frac{\Gamma_e A_e}{\delta x} \phi_E - \frac{\Gamma_e A_e}{\delta x} \phi_P - \frac{\Gamma_w A_w}{\delta x} \phi_P + \frac{\Gamma_w A_w}{\delta x} \phi_W + \bar{S} \cdot (\underbrace{\vee}_{\Delta x \Delta \Delta z}) = 0$$

 \triangleright \bar{S} is the integrated (average) value of the volumetric source term in the cell.

Lecture 4 - The Finite Volume Method in 1D

ME 2256/MEMS 1256

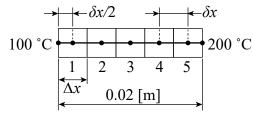

8.2 One-dimensional

8.2.2

8.2.3 Fully Implicit

- Consider a slab with a thickness of 2 [cm] and a thermal conductivity λ=0.5 [W/m-K]. If there exists a uniform heat generation rate of 1,000 [kW/m³], and with the left-hand side is held at 100 °C and the right hand side is held at 200 °C, determine the temperature profile within.
- ▶ Start by creating the numerical domain (5 C. \forall .):

8.2.3 Fully Implicit Scheme

Convective Boundary Conditions

- ▶ We have to reformulate our governing equation for convective boundary conditions.
- ► Recall Newton's law of cooling for a one-dimensional system:

$$\frac{d}{dx}\left(\lambda A \frac{dT}{dx}\right) = hA_s(T - T_\infty)$$

- ► The convective cooling term can be treated as a sink the opposite of a source.
- We will define the variable n^2 as $(hA_s/\lambda A)$ such that, for constant A and λ :

$$\frac{d}{dx}\left(\frac{dT}{dx}\right) - n^2(T - T_{\infty}) = 0$$

> 2.1 Explicit heme

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Convective Boundary Conditions

• We proceed with integration over the control volume, recognizing $T = \phi$ and $\Gamma = \lambda$:

$$\int_{\forall} \frac{d}{dx} \left(\frac{dT}{dx} \right) d\forall - \int_{\forall} n^2 (T - T_{\infty}) d\forall = 0$$

$$\implies \left(A \frac{dT}{dx} \right)_e - \left(A \frac{dT}{dx} \right)_w - n^2 (T_P - T_{\infty}) A \delta x = 0$$

► In terms of cell-centered values using a backward difference:

$$\left(\frac{T_E - T_P}{\delta x}\right) - \left(\frac{T_P - T_W}{\delta x}\right) - n^2 (T_P - T_\infty) \delta x = 0$$

▶ We must proceed with rearranging terms.

.2.1 Explicit cheme

8.2.2 Crank-Nicolson Scheme

8.2.3 Fully Implicit Scheme

Convective Boundary Conditions

► Grouping like terms:

$$\left(\frac{1}{\delta x} + \frac{1}{\delta x}\right) T_P = \frac{1}{\delta x} T_W + \frac{1}{\delta x} T_E + n^2 \delta x T_\infty - n^2 \delta x T_P$$

► Thus, we can rewrite in the form:

$$a_P T_P = a_W T_W + a_E T_E + a_b T_b + \bar{S}$$

with the coefficients:

$$a_P = a_W + a_E + a_b + n^2 \delta x, \ a_W = \frac{1}{\delta x}, \ a_E = \frac{1}{\delta x}$$

 $\bar{S} = n^2 \delta x T_{\infty}$
